

# SQL: The Query Language

## R&G - Chapter 5

## Part 1

We won't be able  
to deliver our product  
in time because of  
some issue with MySQL...

WHAT???

THEN USE  
SOMEBODY ELSE'S  
SQL, BUT I  
WANT THE  
PRODUCT  
IN TIME.

# Databases: the continuing saga

- When last we left databases
  - We knew how to conceptually model them in ER diagrams
  - We knew how to logically model them in the relational model
  - We could formally specify queries
- Now: how do most people write queries?

SQL!

# Coming up in SQL...

- Data Definition Language (reminder)
- Basic Structure
- Set Operations
- Aggregate Functions
- Null Values
- Nested Subqueries
- Modification of the Database
- Views
- Integrity Constraints
- JDBC

# Relational Query Languages

- **A major strength of the relational model: supports simple, powerful *querying*.**
- **Two sublanguages:**
  - DDL – Data Definition Language
    - define and modify schema
  - DML – Data Manipulation Language
    - Queries can be written intuitively.

# DDL – Create Table (Revisited)

- **SQL syntax**
  - CREATE TABLE <name> ( <field> <domain>, ... )
- **Example: creates the Students relation.**

Schema

Students(*sid*: string, *name*: string, *login*: string, *age*: integer, *gpa*: real)

```
CREATE TABLE Students
(sid CHAR(20),
 name CHAR(20),
 login CHAR(10),
 age INTEGER,
 gpa FLOAT)
```

Note: the type  
(domain) of each field  
is specified, and  
enforced by the DBMS

# Create Table (with Integrity Constraints) - Revisited

- A SQL relation is defined using the **create table** command:

– create table  $r$  ( $A_1 D_1, A_2 D_2, \dots, A_n D_n$ ,  
(integrity-constraint<sub>1</sub>),  
...,  
(integrity-constraint<sub>k</sub>))

- *Integrity constraints can be:*
  - *primary and candidate keys*
  - *foreign keys*

```
CREATE TABLE films (  
  code          CHAR(5) PRIMARY KEY,  
  title         VARCHAR(40),  
  did           DECIMAL(3),  
  date_prod     DATE,  
  kind          VARCHAR(10),  
  FOREIGN KEY did REFERENCES dist  
  ON DELETE NO ACTION  
);
```

# DML – Querying Databases

- A simple SQL query has the form:

**SELECT**  $A_1, A_2, \dots, A_n$   
**FROM**  $r_1, r_2, \dots, r_m$   
**WHERE**  $P$

- $A_i$  represents an attribute
  - $r_i$  represents a relation
  - $P$  is a predicate
- This query is equivalent to the relational algebra expression:

**Select**  
 $\Pi_{A_1, A_2, \dots, A_n} (\sigma_P (r_1 \times r_2 \times \dots \times r_m))$   
**Where** **From**

# The SELECT clause

- **Equivalent to projection ( $\pi$ ) operator**

- *E.g.*,  $\pi_{\text{stud\#, name}} \text{Students}$

- *In SQL:*

```
SELECT stud#, name
FROM Students;
```

- **Can use “\*” to get all attributes**

```
SELECT *
FROM Students;
```
- **By default, duplicates are preserved**
- **Can include arithmetic expressions in SELECT**
- **e.g., SELECT bname, acct\_no, balance\*1.05**  
**FROM account**

# Selecting Distinct Values

- In SQL SELECT, the default is that duplicates are not eliminated! (Result is called a “multiset”)
- Can write SELECT **DISTINCT** to eliminate duplicates

Student

<i>stud#</i>	<i>name</i>	<i>address</i>
100	Fred	Aberdeen
200	Dave	Dundee
300	Bob	Aberdeen

SELECT DISTINCT address

FROM Student;

<i>address</i>
Aberdeen
Dundee

# The WHERE clause

- **Equivalent to selection ( $\sigma$ ) operator**
  - E.g.,  $\sigma_{\text{course} = \text{'Computing'}} \text{Students}$
  - *In SQL:*
    - Select \*
    - From Students
    - Where course = 'Computing';

# The WHERE clause

- **WHERE predicate can be:**
  - Simple:
    - *attribute* op *constant*, or
    - *Attribute1* op *attribute2*
    - Op: <, <=, =, ≠, >=, >
    - attribute names should come from the relation(s) used in the FROM
  - Complex:
    - using AND, OR, NOT, BETWEEN, IN, LIKE
  - Allow arithmetic operations (e.g., WHERE rating\*2>200)
  - Allow string operations (e.g., "||" for concatenation).

# Connectives in WHERE Predicate

- **Relational Algebra:**

- $\wedge$  (and),  $\vee$  (or),  $\neg$  (not)

- $\pi_{bname}(\sigma_{color='red' \vee color='green'}(Boats))$

- **SQL:**

- AND, OR, NOT

- ```
SELECT Bname
```

- ```
FROM Boats
```

- ```
WHERE color='red' OR color='green';
```

# Using Quotes in Selection Conditions

- SQL uses single quotes around text values (most database systems will also accept double quotes).
- Numeric values should NOT be enclosed in quotes.

For text values:

This is correct:

```
SELECT * FROM Persons WHERE FirstName='Tove'
```

This is wrong:

```
SELECT * FROM Persons WHERE FirstName=Tove
```

# BETWEEN Operator in WHERE Clause

```
SELECT *  
FROM Book  
WHERE catno BETWEEN 200 AND 400;
```

```
SELECT *  
FROM Product  
WHERE prod_desc BETWEEN 'C' AND 'S';
```

```
SELECT *  
FROM Book  
WHERE catno NOT BETWEEN 200 AND 400;
```

# IN Operator in WHERE Clause

```
SELECT Name  
FROM Member  
WHERE memno IN (100, 200, 300, 400);
```

```
SELECT Name  
FROM Member  
WHERE memno NOT IN (100, 200, 300, 400);
```

# IS/NOT Operators in WHERE Clause

- Most useful for missing values in database

```
SELECT Catno  
FROM Loan  
WHERE Date-Returned IS NULL;
```

```
SELECT Catno  
FROM Loan  
WHERE Date-Returned IS NOT NULL;
```

# LIKE Operator in WHERE Clause

- “LIKE” is used for string approximate matching.
  - ‘\_’ stands for any single character and
  - ‘%’ stands for 0 or more arbitrary characters.

```
SELECT Name  
FROM Member  
WHERE address LIKE 'T%';
```

```
SELECT Name  
FROM Member  
WHERE Name NOT LIKE '_ES%';
```

# An Example of String Operations

```
SELECT 2*S.Salary AS DoubleSalary, TripleSalary =3*S.Salary  
FROM MovieStar S  
WHERE S.Name LIKE 'B_%T';
```

- AS and = are two ways to name fields in result.
- What does this query return?

# The FROM clause

- **Cross-product ( X ) or Join  $\bowtie$  of tables T1, ...Tn**
  - multiple tables T1, .... Tn, in the FROM clause

# Cross Product Example

| <u>sid</u> | <u>bid</u> | <u>day</u> |
|------------|------------|------------|
| 22         | 101        | 10/10/96   |
| 58         | 103        | 11/12/96   |

**R1**

| <u>sid</u> | sname  | rating | age  |
|------------|--------|--------|------|
| 22         | dustin | 7      | 45.0 |
| 31         | lubber | 8      | 55.5 |
| 58         | rusty  | 10     | 35.0 |

**S1**

*Select \**  
*FROM R1, S1;*

**R1 X S1 =**

| (sid) | sname  | rating | age  | (sid) | bid | day      |
|-------|--------|--------|------|-------|-----|----------|
| 22    | dustin | 7      | 45.0 | 22    | 101 | 10/10/96 |
| 22    | dustin | 7      | 45.0 | 58    | 103 | 11/12/96 |
| 31    | lubber | 8      | 55.5 | 22    | 101 | 10/10/96 |
| 31    | lubber | 8      | 55.5 | 58    | 103 | 11/12/96 |
| 58    | rusty  | 10     | 35.0 | 22    | 101 | 10/10/96 |
| 58    | rusty  | 10     | 35.0 | 58    | 103 | 11/12/96 |

# Natural Join Example

| Sid | Bid | day      |
|-----|-----|----------|
| 22  | 101 | 10/10/96 |
| 58  | 103 | 11/12/96 |

**R1**

| Sid | Sname  | Rating | Age  |
|-----|--------|--------|------|
| 22  | Dustin | 7      | 45.0 |
| 31  | Lubber | 8      | 55.5 |
| 58  | Rusty  | 10     | 35.5 |

**S1**

*Select R1.sid, sname, ratings, age, bid, day  
FROM R1, S1  
WHERE R1.sid = S1.sid;*

**R1** ⋈ **S1** =

| Sid | Sname  | Rating | Age  | Bid | day      |
|-----|--------|--------|------|-----|----------|
| 22  | Dustin | 7      | 45.0 | 101 | 10/10/96 |
| 58  | Rusty  | 10     | 35.0 | 103 | 11/12/96 |

- Note**

- WITHOUT WHERE clause: cross-product;
- WITH WHERE clause (on common attributes): natural-join

# Another Way to Specify Natural Join

- **Syntax**

*SELECT A1, ...An  
FROM R NATURAL JOIN S;*

- **More variants of NATURAL JOIN operator will be discussed in later lectures.**

# Conditional Join Example

| Sid | Bid | day      |
|-----|-----|----------|
| 22  | 101 | 10/10/96 |
| 58  | 103 | 11/12/96 |

**R1**

| Sid | Sname  | Rating | Age  |
|-----|--------|--------|------|
| 22  | Dustin | 7      | 45.0 |
| 31  | Lubber | 8      | 55.5 |
| 58  | Rusty  | 10     | 35.5 |

**S1**

*Select S1.sid, sname, ratings, age, bid, day  
FROM R1, S1  
WHERE S1.sid < R1.sid;*

| S1.sid | Sname  | Rating | Age  | Bid | day      |
|--------|--------|--------|------|-----|----------|
| 22     | Dustin | 7      | 45.0 | 103 | 11/12/96 |
| 31     | Lubber | 8      | 55.5 | 103 | 11/12/96 |

$\pi_{s1.sid, sname, ratings, age, bid, day} (S1 \bowtie_{S1.sid < R1.sid} R1)$

# Range Variables

- Can associate “range variables” with the tables in the FROM clause.
  - saves writing, makes queries easier to understand

```
SELECT sname  
FROM Sailors, Reserves  
WHERE Sailors.sid=Reserves.sid AND bid=103
```

Can be  
rewritten using  
range variables as:

```
SELECT S.sname  
FROM Sailors S, Reserves R  
WHERE S.sid=R.sid AND bid=103
```

- Needed when ambiguity could arise.
  - for example, if same table used multiple times in same FROM (called a “self-join”)

# Example of Range Variables in Self-Join

```
SELECT  x.sname  
FROM    Sailors x, Sailors y  
WHERE   x.age > y.age
```

Question: what does this query return?

# Combinations of Operators

Schema:

- Students (sid, cid, sname, address)
- Courses (cid, cname)

$R1 = \text{Students} \bowtie (\sigma_{\text{cname}='CS442'} \text{Courses})$

$R2 = \sigma_{\text{address}="Hoboken"} R1$

$R3 = \pi_{\text{Students.sname, Course.cname}} R2$

Translate the relational algebra expressions into SQL statement
