

Inductive Sets and Recursion

CS496

Inductively Specified Set

- ▶ A means of defining sets that
 1. Describes how to generate its elements
 - ▶ Derivations
 2. Comes equipped with a technique for proving properties of its elements
 - ▶ Structural Induction
 3. Comes equipped with a technique for defining functions over its elements
 - ▶ Structural Recursion

Specifying an Inductive Definition

All inductive definitions require specifying two elements

1. A universe

- ▶ In PL the universe is typically specified by giving an alphabet Σ and then taking the universe to be the set of all words from that alphabet

2. The smallest subset of the universe that satisfies certain conditions

- ▶ This set is therefore a subset of the words in Σ

An Example of A Universe

Let Σ be the set of symbols

$$(\quad) \quad z \quad s$$

The set of words over Σ , denoted Σ^* , consists of

$$\{z, s, zz, sz, zs, ss, zsss, s, s((, ()), \dots\}$$

A First Example of an Inductive Definition

- ▶ We already specified the universe in the previous slide
- ▶ Now let's specify the inductive set properly

Example of inductive definition

Let S be the **smallest** subset of Σ^* that satisfies:

1. $z \in S$,
2. $s(n) \in S$ whenever $n \in S$.

- ▶ The first clause is called the **base** clause or rule
- ▶ The second clause is called the **inductive** clause or rule

A First Example (cont.)

Let S be the **smallest** subset of Σ^* that satisfies:

1. $z \in S$,
2. $s(n) \in S$ whenever $n \in S$.

What sets satisfy the specification?

A First Example (cont.)

Let S be the **smallest** subset of Σ^* that satisfies:

1. $z \in S$,
2. $s(n) \in S$ whenever $n \in S$.

What sets satisfy the specification?

- ▶ $\{z, s(z), s(s(z)), s(s(s(z))), \dots\}$
- ▶ $\{z, s(z), s(s(z)), s(s(s(z))), \dots\} \cup \{s, s(s), s(s(s)), \dots\}$

Smallest implies:

- ▶ **Exactly** those elements generated by the specification
- ▶ We can give a **derivation** showing why each element belongs in the set.

Derivation of Set Elements

Let S be the **smallest** subset of Σ^* satisfying

1. $z \in S$,
2. $s(z) \in S$ whenever $n \in S$.

Example: $s(s(s(z)))$

- ▶ $z \in S$ (by rule 1)
- ▶ $s(z) \in S$ (by rule 2)
- ▶ $s(s(z)) \in S$ (by rule 2)
- ▶ $s(s(s(z))) \in S$ (by rule 2)

Non-example: zs

Example: Primary Colors

- ▶ Let Σ be the English alphabet

Primary Colors defined inductively

Let $PCol$ be the **smallest** subset of Σ^* that satisfies:

1. $Red \in PCol$
2. $Green \in PCol$
3. $Blue \in PCol$

- ▶ This definition only has **base** clauses
- ▶ It defines a finite set, namely $\{Red, Green, Blue\}$

Simplifying the Definition of Inductive Sets – Dropping the Universe

- ▶ As mentioned, Σ^* below is known as the **universe**

Let S be the **smallest subset of Σ^*** satisfying

1. $z \in S$,
2. $s(z) \in S$ whenever $n \in S$.

- ▶ We often drop the reference to the universe

Let S be the **smallest set** satisfying

1. $z \in S$,
2. $s(z) \in S$ whenever $n \in S$.

- ▶ It is mathematically less precise, but sufficiently precise for our programming examples

Alternative Notations for Defining Inductive Sets

We'll briefly introduce three alternative notations for defining inductive sets

1. Prose (already seen) notation
2. Rule notation
3. BNF notation

For each we will exemplify with the set of natural numbers and a derivation of one of its elements

Notation 1 – Prose

Sample definition

Let S be the smallest set that satisfies:

1. $z \in S$,
2. $s(n) \in S$ whenever $n \in S$.

Sample derivation

- ▶ $z \in S$ (by rule 1)
- ▶ $s(z) \in S$ (by rule 2)
- ▶ $s(s(z)) \in S$ (by rule 2)

Notation 2 – Rule Notation

Sample definition

$$\frac{}{z \in S} \text{ Rule 1} \qquad \frac{n \in S}{s(n) \in S} \text{ Rule 2}$$

Sample derivation

$$\frac{\frac{\frac{}{z \in S} \text{ Rule 1}}{s(z) \in S} \text{ Rule 2}}{s(s(z)) \in S} \text{ Rule 2}$$

Notation 3 – BNF or Grammar Notation

Sample definition

$$\begin{aligned}\langle S \rangle &::= z \\ \langle S \rangle &::= s(\langle S \rangle)\end{aligned}$$

- ▶ $\langle S \rangle$ is called a **non-terminal**
- ▶ $z, s, ($ and $)$ are called **terminals**
- ▶ This definition can be abbreviated

$$\langle S \rangle ::= z \mid s(\langle S \rangle)$$

Sample derivation

$$\begin{aligned}\langle S \rangle &\Rightarrow s(\langle S \rangle) \\ &\Rightarrow s(s(\langle S \rangle)) \\ &\Rightarrow s(s(z))\end{aligned}$$

Primary Colors in Rule Notation

$$\overline{Red \in PCol} \quad \overline{Green \in PCol}$$

$$\overline{Blue \in PCol}$$

Examples of elements of $PCol$

- ▶ *Red*
- ▶ *Green*

Another example: Lists (over a set S)

$$\frac{}{nil \in List(S)}$$
$$\frac{s \in S \quad l \in List(S)}{s :: l \in List(S)}$$

Examples of elements of $List(\mathbb{N})$

- ▶ nil
- ▶ $4 :: nil$
- ▶ $1 :: 2 :: 5 :: 0 :: nil$

Another inductive set: Trees (over a set S)

$$\frac{s \in S}{\text{leaf}(s) \in BTree(S)}$$
$$\frac{l \in BTree(S) \quad r \in BTree(S)}{\text{node}(l, r) \in BTree(S)}$$

Example of elements in $Btree(\mathbb{N})$

- ▶ $\text{leaf}(2)$
- ▶ $\text{node}(\text{leaf}(2), \text{leaf}(3))$
- ▶ $\text{node}(\text{node}(\text{leaf}(2), \text{node}(\text{leaf}(7), \text{leaf}(2))), \text{node}(\text{leaf}(2), \text{leaf}(1)))$

Inductive Sets

Defining Functions over Inductive Sets

Representing Inductive Sets in Scheme

Proving Properties of Elements of Inductive Sets

Defining functions over inductive sets

- ▶ **Structural recursion**: technique for defining functions over inductive sets S
- ▶ When defining f over an inductive set S return:
 - ▶ Known values, for s in S justified by **base rules**
 - ▶ Composition of known values and f applied to the parts that conform s , for s in S justified by **inductive rules**

Example

Let S be the subset of Σ^*
satisfying

1. $z \in S$,
2. $s(z) \in S$ whenever $n \in S$.

$$noOfSuc :: S \rightarrow \mathbb{N}$$

$$\begin{aligned} noOfSuc(z) &= 0 \\ noOfSuc(s(n)) &= 1 + noOfSuc(n) \end{aligned}$$

Simple functions over $List(\mathbb{Z})$ in Scheme

$sizeL :: List(\mathbb{N}) \rightarrow \mathbb{N}$

$$sizeL(nil) = 0$$

$$sizeL(n :: l) = 1 + sizeL(l)$$

$sumL :: List(\mathbb{N}) \rightarrow \mathbb{N}$

$$sumL(nil) = 0$$

$$sumL(n :: l) = n + sumL(l)$$

Recursive Functions over Trees of Numbers

$$\frac{n \in S}{\text{leaf}(n) \in BTree(S)}$$

$$\frac{l \in BTree(S) \quad r \in BTree(S)}{\text{node}(l, r) \in BTree(S)}$$

$noOfNodes :: Tree(\mathbb{N}) \rightarrow \mathbb{N}$

$noOfNodes(\text{leaf}(n)) = 1$

$noOfNodes(\text{node}(l, r)) = 1 + noOfNodes(l) + noOfNodes(r)$

Recursive Functions over Trees of Numbers

$$\frac{n \in S}{\text{leaf}(n) \in BTree(S)}$$

$$\frac{l \in BTree(S) \quad r \in BTree(S)}{\text{node}(l, r) \in BTree(S)}$$

$\text{incTree} :: \text{Tree}(\mathbb{N}) \rightarrow \text{Tree}(\mathbb{N})$

$\text{incTree}(\text{leaf}(n)) = \text{leaf}(n + 1)$

$\text{incTree}(\text{node}(l, r)) = \text{node}(\text{incTree}(l), \text{incTree}(r))$

Inductive Sets

Defining Functions over Inductive Sets

Representing Inductive Sets in Scheme

Proving Properties of Elements of Inductive Sets

Representing Inductive Sets in Scheme

- ▶ We'll show how to represent inductive definitions in Scheme
- ▶ There are two ways to do this
 1. Encode using already existing types in Scheme
 2. Define new user defined types for each inductive definition
- ▶ The second is better than the first since user defined data types represent ADT
- ▶ However, today we shall see the first alternative (we work with what we have)
- ▶ We leave the second for next class

Representing the set $List(\mathbb{N})$ in Scheme

Inductive Set (Maths)

$$\frac{}{nil \in List(\mathbb{N})} \qquad \frac{s \in \mathbb{N} \quad l \in List(\mathbb{N})}{s :: l \in List(\mathbb{N})}$$

Encoding in Scheme (PL)

$\langle \text{list-of-numbers} \rangle ::= () \mid (\langle \text{number} \rangle . \langle \text{list-of-numbers} \rangle)$

Example:

- ▶ The Scheme expression $(1 . (2 . (3 . ())))$ represents the list $1::2::3::nil$

Trees of Numbers in Scheme

Inductive Set (Maths)

$$\frac{n \in \mathbb{N}}{\text{leaf}(n) \in BTree(\mathbb{N})} \quad \frac{l \in BTree(\mathbb{N}) \quad r \in BTree(\mathbb{N})}{\text{node}(l, r) \in BTree(\mathbb{N})}$$

Encoding in Scheme (PL)

$$\langle \text{btree} \rangle ::= \langle \text{number} \rangle \mid (\langle \text{btree} \rangle . \langle \text{btree} \rangle)$$

Example:

- ▶ The Scheme expression $((2 \ . \ 2) \ . \ (5 \ . \ (7 \ . \ 8)))$ encodes the tree
 $\text{node}(\text{node}(\text{leaf}(2), \text{leaf}(2)), \text{node}(\text{leaf}(5), \text{node}(\text{leaf}(7), \text{leaf}(8))))$

Recursive Functions over Inductive Sets in Scheme

- ▶ We have encoded inductive sets in Scheme
- ▶ We have also seen how to define recursive functions over inductive sets
- ▶ Thus we can now encode in Scheme these recursive functions
- ▶ We'll do that for the examples of recursive functions already seen
- ▶ Towards the end of the class we shall see some more examples

Computing the sum of a list in Scheme

$\langle \text{list-of-numbers} \rangle ::= () \mid (\langle \text{number} \rangle . \langle \text{list-of-numbers} \rangle)$

```
1 ;; list-sum :: [number?] -> number?
2 (define list-sum
3   (lambda (l)
4     (match l
5       ['() 0]
6       [(cons h t) (+ h (list-sum t))]
7     )))
```

Key points:

- ▶ recursion occurs in procedure exactly where recursion occurs in BNF
- ▶ we may assume procedure “works” for sub-structures of the same type

More Examples

Add one to each element:

```
1 >(list-inc '())  
2 '()  
3 >(list-inc '(1))  
4 '(2)  
5 >(list-inc '(1 2 3))  
6 '(2 3 4)
```

Append:

```
1 >(list-app '(1 2 3) '(4 5))  
2 '(1 2 3 4 5)  
3 >(list-app '() '(4 5))  
4 '(4 5)
```

More Examples of Recursive Functions

```
1 ;; ??
2 (define list-inc
3   (lambda (l)
4     (match l
5       ['() '()]
6       [(cons h t) (cons (+ h 1) (list-inc t))]
7       )))
8
9 ;; ??
10 (define list-app
11   (lambda (l1 l2)
12     (match l1
13       ['() l2]
14       [(cons h t) (cons h (list-app t l2))]
15       )))
```

Trees of Numbers $BTree(\mathbb{N})$ in Scheme

$$\langle btree \rangle ::= \langle number \rangle \mid (\langle btree \rangle . \langle btree \rangle)$$

Procedure template:

```
1 ;; BTree? number? -> ??  
2 (define tree-rec  
3   (lambda (t)  
4     (match t  
5       [(? number?) ...]  
6       [(cons l r) (..(tree-rec l)...(tree-rec r)...)]  
7     )))
```

- The pattern `(? number?)` means: check to see if `(number? t)` is true, if so take this branch

Tree Examples

```
1 >(tree-sum '((2 . 3) . ( 1 . (4 . 5))))
```

```
2 15
```

```
3  
4 >(tree-flip '((2 . 3) . ( 1 . (4 . 5))))
```

```
5 '(((5 . 4) . 1) . (3 . 2)))
```

Tree Examples

```
1 ;; BTree? number? -> number?
2 (define tree-sum
3   (lambda (t)
4     (match t
5       [(? number?) t]
6       [(cons l r) (+ (tree-sum l) (tree-sum r))]
7     )))
8
9 ;; BTree? a -> BTree? a
10 (define tree-flip
11   (lambda (t)
12     (match t
13       [(? number?) t]
14       [(cons l r) (cons (tree-flip r) (tree-flip l))]
15     )))
```

Inductive Sets

Defining Functions over Inductive Sets

Representing Inductive Sets in Scheme

Proving Properties of Elements of Inductive Sets

Proof by Structural Induction

S is an inductive set and P is a property of its elements

- ▶ How to prove

$$\forall x \in S. P(x)$$

- ▶ Resort to **Structural Induction**:
 1. Prove P is true on simple structures (base rules).
 2. Prove that, if P is true on the substructures of x (Induction Hypothesis), then it is true on x itself (inductive rules).

Example of Proof using Structural Induction

$$\frac{n \in \mathbb{N}}{\text{leaf}(n) \in BTree(\mathbb{N})} \qquad \frac{l \in BTree(\mathbb{N}) \quad r \in BTree(\mathbb{N})}{\text{node}(l, r) \in BTree(\mathbb{N})}$$

Consider

$P(t) =$ “ t contains an odd number of nodes”

- ▶ Aim: prove $\forall t \in BTree(\mathbb{N}). P(t)$
- ▶ Tool: use Structural Induction

Example of Proof using Structural Induction (cont.)

$$\frac{n \in \mathbb{N}}{\text{leaf}(n) \in BTree(\mathbb{N})} \qquad \frac{l \in BTree(\mathbb{N}) \quad r \in BTree(\mathbb{N})}{\text{node}(l, r) \in BTree(\mathbb{N})}$$

Consider

$P(t) = \text{"}t \text{ contains an odd number of nodes"}$

- ▶ Base case:
 - ▶ $t = \text{leaf}(i)$, where i is a number.
 - ▶ Reasoning: $P(t)$ holds immediately since a leaf is a node and 1 is odd.
- ▶ Inductive case: (next slide)

Example of Proof using Structural Induction (cont.)

$$\frac{n \in \mathbb{N}}{\text{leaf}(n) \in BTree(\mathbb{N})} \qquad \frac{l \in BTree(\mathbb{N}) \quad r \in BTree(\mathbb{N})}{\text{node}(l, r) \in BTree(\mathbb{N})}$$

Consider

$P(t) = "t \text{ contains an odd number of nodes}"$

► Inductive case:

- $t = \text{node}(t_1, t_2)$, where t_1, t_2 are binary trees.
- Reasoning: By the IH t_1 has an odd number of nodes. Similarly, so does t_2 . Since the number of nodes of $\text{node}(t_1, t_2)$ is 1 plus the sum of the nodes of t_1 and t_2 , we conclude.

Another Example

- Prove

$$\forall t \in BTree(\mathbb{N}). P(t)$$

$P(t)$ = “ t and $incTree(t)$ have the same number of (non-leaf) nodes”

- Recall:

$$incTree :: Tree(\mathbb{N}) \rightarrow Tree(\mathbb{N})$$

$$incTree(leaf(n)) = leaf(n + 1)$$

$$incTree(node(l, r)) = node(incTree(l), incTree(r))$$

- Resort to **Structural Induction**:

1. Prove P is true on simple structures (base rules).
2. Prove that, if P is true on the substructures of t (IH), then it is true on t itself (inductive rules).

Example of Proof using Structural Induction (cont.)

$$\frac{n \in \mathbb{N}}{\text{leaf}(n) \in BTree(\mathbb{N})} \qquad \frac{l \in BTree(\mathbb{N}) \quad r \in BTree(\mathbb{N})}{\text{node}(l, r) \in BTree(\mathbb{N})}$$

$$\forall t \in BTree(\mathbb{N}). P(t)$$

where $P(t)$ is “ t and $incTree(t)$ have the same number of nodes”

► Base case:

- $t = \text{leaf}(i)$, where i is a number.
- Reasoning: Then $incTree(\text{leaf}(i)) = \text{leaf}(i + 1)$ and clearly both $\text{leaf}(i)$ and $\text{leaf}(i + 1)$ have 0 nodes.

Example of Proof using Structural Induction (cont.)

$$\frac{n \in \mathbb{N}}{\text{leaf}(n) \in BTree(\mathbb{N})} \qquad \frac{l \in BTree(\mathbb{N}) \quad r \in BTree(\mathbb{N})}{\text{node}(l, r) \in BTree(\mathbb{N})}$$

$$\forall t \in BTree(\mathbb{N}). P(t)$$

where $P(t)$ is “ t and $incTree(t)$ have the same number of nodes”

► Inductive case:

- $t = \text{node}(t_1, t_2)$, where t_1, t_2 are binary trees.
- Reasoning: By the IH both t_1 and $incTree(t_1)$ have the same number of nodes. Similarly, both t_2 and $incTree(t_2)$ have the same number of nodes. Therefore, since

$$\text{incTree}(\text{node}(t_1, t_2)) = \text{node}(\text{incTree}(t_1), \text{incTree}(t_2))$$

we may conclude.

Summary

- ▶ Inductive Sets: technique for defining sets
- ▶ Structural Recursion: technique for defining functions over inductive sets
- ▶ Structural Induction: technique for proving properties of inductive sets
